## HAZARD COMMUNICATION - MSDS

Material Safety Data Sheets (MSDS) contain useful information for chemical products used in the workplace. The potential health effects, hazards of its use, and the chemical content are listed on the MSDS.

Many of the recommendations listed on a Material Safety Data Sheet are common sense. This information is very

important to enable you to use and handle the chemical properly. Always follow the manufacturer's recommended procedures for use as described on the container label. If you have any questions or do not understand the information on a MSDS, contact your supervisor for assistance.

Remember, it is your responsibility to your family, fellow employees and yourself to understand the proper procedures associated with working with chemicals in the workplace.
